X509 Authentication

- X509 Certificates and PKI (Public Key Infrastructure)

Outline

- **X509 Authentication**
 - X509 Authentication and Key Management Issues
- **X509 Certificates**
 - X509 and X509 v3 Certificates
 - X509 v3 Extensions
 - Life-Cycle Management of X509 Certificates
 - Authentication procedures
 - Forward and reverse certification chains
 - Revocation
 - The possible long tail of certification chains
- **PKI - Public Key Infrastructure**
 - PKI Standardization and PKIX Management
- **Complementary: Key Management Issues**

Outline

- **X509 Authentication**
 - X509 Authentication and Key Management Issues
- X509 Certificates
 - X509 and X509 v3 Certificates
 - X509 v3 Extensions
 - Life-Cycle Management of X509 Certificates
 - Authentication procedures
 - Forward and reverse certification chains
 - Revocation
 - The possible long tail of certification chains
- PKI - Public Key Infrastructure
 - PKI Standardization and PKIX Management
- Complementary: Key Management Issues

X509 Authentication

- Based on Algorithms and Constructions for Digital Signatures of Identity Claims (Asymmetric or Public-Key Cryptography) and Trusted X509 Certificates and Certification Chains)
- Supported in Authentication Protocols involving:
 - Authentication claimants of digital identities:
 - SIGNERS if Authentication Proofs
 - Authentication Validation
 - Authenticators, using verification of signed identity authentication proofs
 - Typical use of digital signatures: standardized constructions (as studied before)

X509 Authentication:

Signers as authenticated identity claimants

Signer (as the authentication of claimant of digital identity claim)

- Digital identity as unique identifier (UID)
- Control of the keypair generation process
- Must keep Private Key (related to exhibited X509 certificates) w/ required security assumptions
- Need that correspondent public-key must be known by the verifier (as the Authenticator peer): certified in X509 certificates
 - Certificates can be publicly exhibited: in a protocol, signers can send their public-key certificates
 - Certificates are issued by Trusted Certification Authorities

X509 Authentication:

Identity Authenticators (as verifiers)

Authenticator (as the verifier of the claimed identity signatures):

- Need to know/obtain public key of the claimant UID in a trusted way, to verify the signed authentication claim
 - Can obtain from X509 public-key certificates
- For X509 Authentication, trust assumptions are based on obtaining and managing X509 certificates (as trusted public key certificates)
 - Role provided by Trusted Certification Authorities as issuers of X509 certificates
 - Also trusted by the verifiers

Outline

- **X509 Authentication**
 - X509 Authentication and Key Management Issues
- **X509 Certificates**
 - X509 and X509 v3 Certificates
 - X509 v3 Extensions
 - Life-Cycle Management of X509 Certificates
 - Authentication procedures
 - Forward and reverse certification chains
 - Revocation
 - The possible long tail of certification chains
- **PKI - Public Key Infrastructure**
 - PKI Standardization and PKIX Management
- **Complementary: Key Management Issues**

X.509 Standardization

X509: a standard framework, part of the ITU-T X500 standardization effort, initially targeted for:

- Provision of authentication services by X500 directory service
- Standard representation of keys and public key certificates (formats and their attributes and data representation types), as well as recommended cryptography (algorithms and parameters)
 - Currently: X509v3 Certificates and X509v3 EV (Extended Validation) Certificates
 - Canonical Encoding Standardization
- Framework to address PKI systems (Public Key Infrastructures)
 - Processes, entity roles, interfaces)
 - Life cycle management of certificates: generation, enrollment, certification requests, certificate issuing, validation, revocation

Standardization: 1988, 1993 (v1), 1995 (v2), 2000 (v3), ...

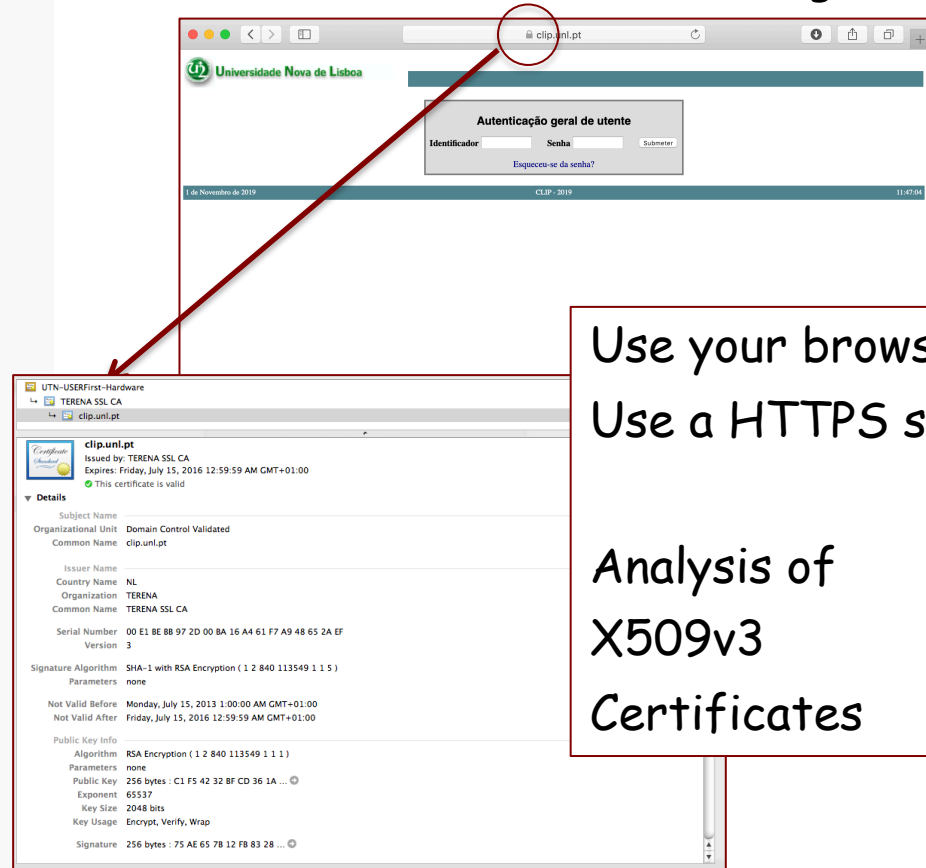

IETF RFC 2459 (Jan 1999) RFC 8399 (May/2018)

X.509 v3 Certificate: Structure, Attributes, Extensions, Classifiers

Notation:

$CA \ll A \gg = \{A, V, SN, AI, CA, TA, K_{pubA}\}_{SigCA}$

Use your browser
Use a HTTPS site

Analysis of
X509v3
Certificates

X509 certificate (Extended attributes: improved in different versions)

X.509 Certificates

Each certificate contains:

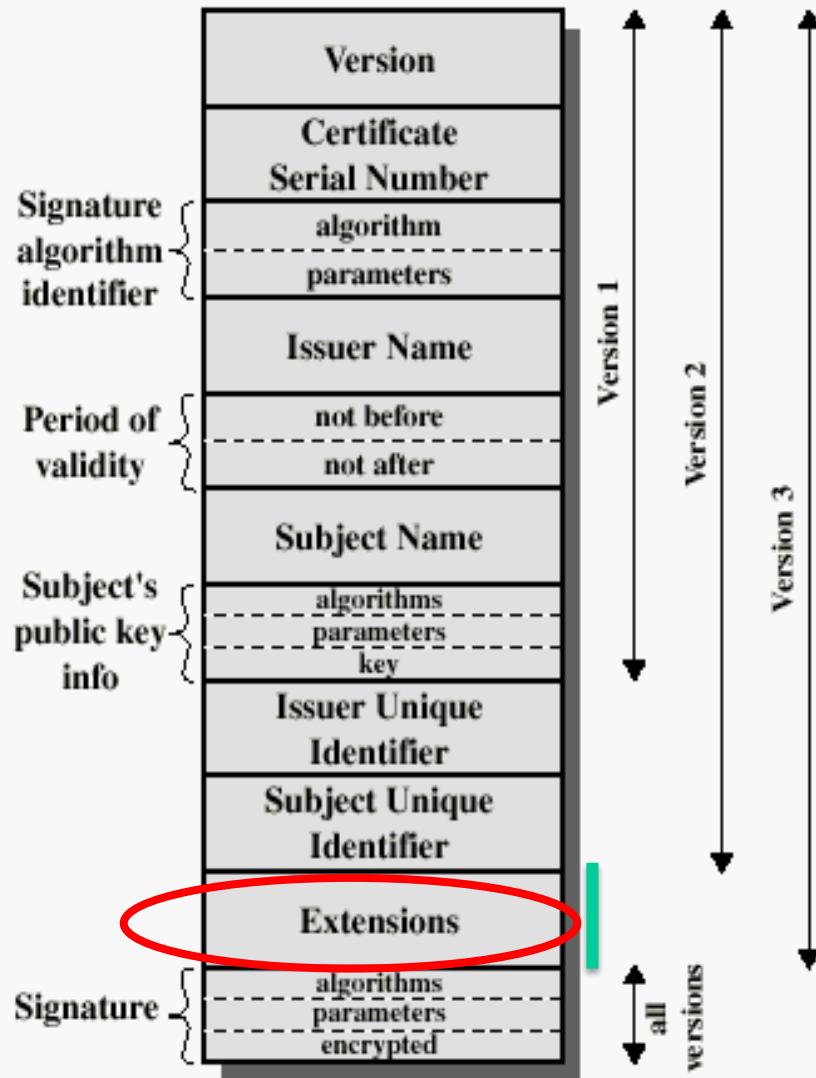

- The public key of a distinguished subject name (principal, user)
 - Subject name, Subject's public key information fields
- Other attributes with additional information as a list of other (field, value) pairs
 - Issuer UID, serial number, version, validity information, relevant information of cipher-suites used, verification control information, several extensions and fingerprints
- Signed with the private key of a CA.
 - Digital signature covering all the other fields
 - Hash of fields, signed with the CA private key

Discussion: see the different fields, policies and extended attributes in current X509v3 Certificates

Outline

- 
- **X509 Authentication**
 - X509 Authentication and Key Management Issues
 - **X509 Certificates**
 - X509 and X509 v3 Certificates
 - X509 v3 Extensions
 - Life-Cycle Management of X509 Certificates
 - Authentication procedures
 - Forward and reverse certification chains
 - Revocation
 - The possible long tail of certification chains
 - **PKI - Public Key Infrastructure**
 - PKI Standardization and PKIX Management
 - **Complementary: Key Management Issues**

X.509 Certificate and CRL Formats

A set of one or more Extension Fields:

- Key Usage
- Constraints
- Extended Key Usage
- Subject Key Identifier
- Authority Key Identifier
- Subject Alt. Names
- Certificate Policies
- CRL Dist. Endppoints
- ESCT List
- Certificate Authority Information ACcess

X509 certificate (versions and attributes)

X509v3 Validation

Other validation issues of certificates for specific validation requirements

- **Subject Name** (fields and attributes)
 - Not only abstract UIDs, URIs, URLs, eMail addresses, ...
 - Extended with X500 distinguished name attributes and classification categories as well as alternative names
- **Issuer name**
 - Issuer/CA Distinguished names with X500 attributes
- **Certif. policies, policy mappings and key policies**
 - Allowing for specific validation to a given policy
 - Setting constraints for limitation/contention of the damage from faulty or malicious Cas

Other validation issues of certificates for specific validation requirements

- Inclusion of KeyIDs for Subject and Authority, as Key Selectors
- Information on CRL distribution points or for OnLine Status verification points (OCSP) from CA issuers
- Gradual adoption of OID standardization
- Fingerprints with Dual Secure Hashing Functions for Integrity:
 - Current use of SHA-256 and SHA-1

Extended validation (EV) Certificates

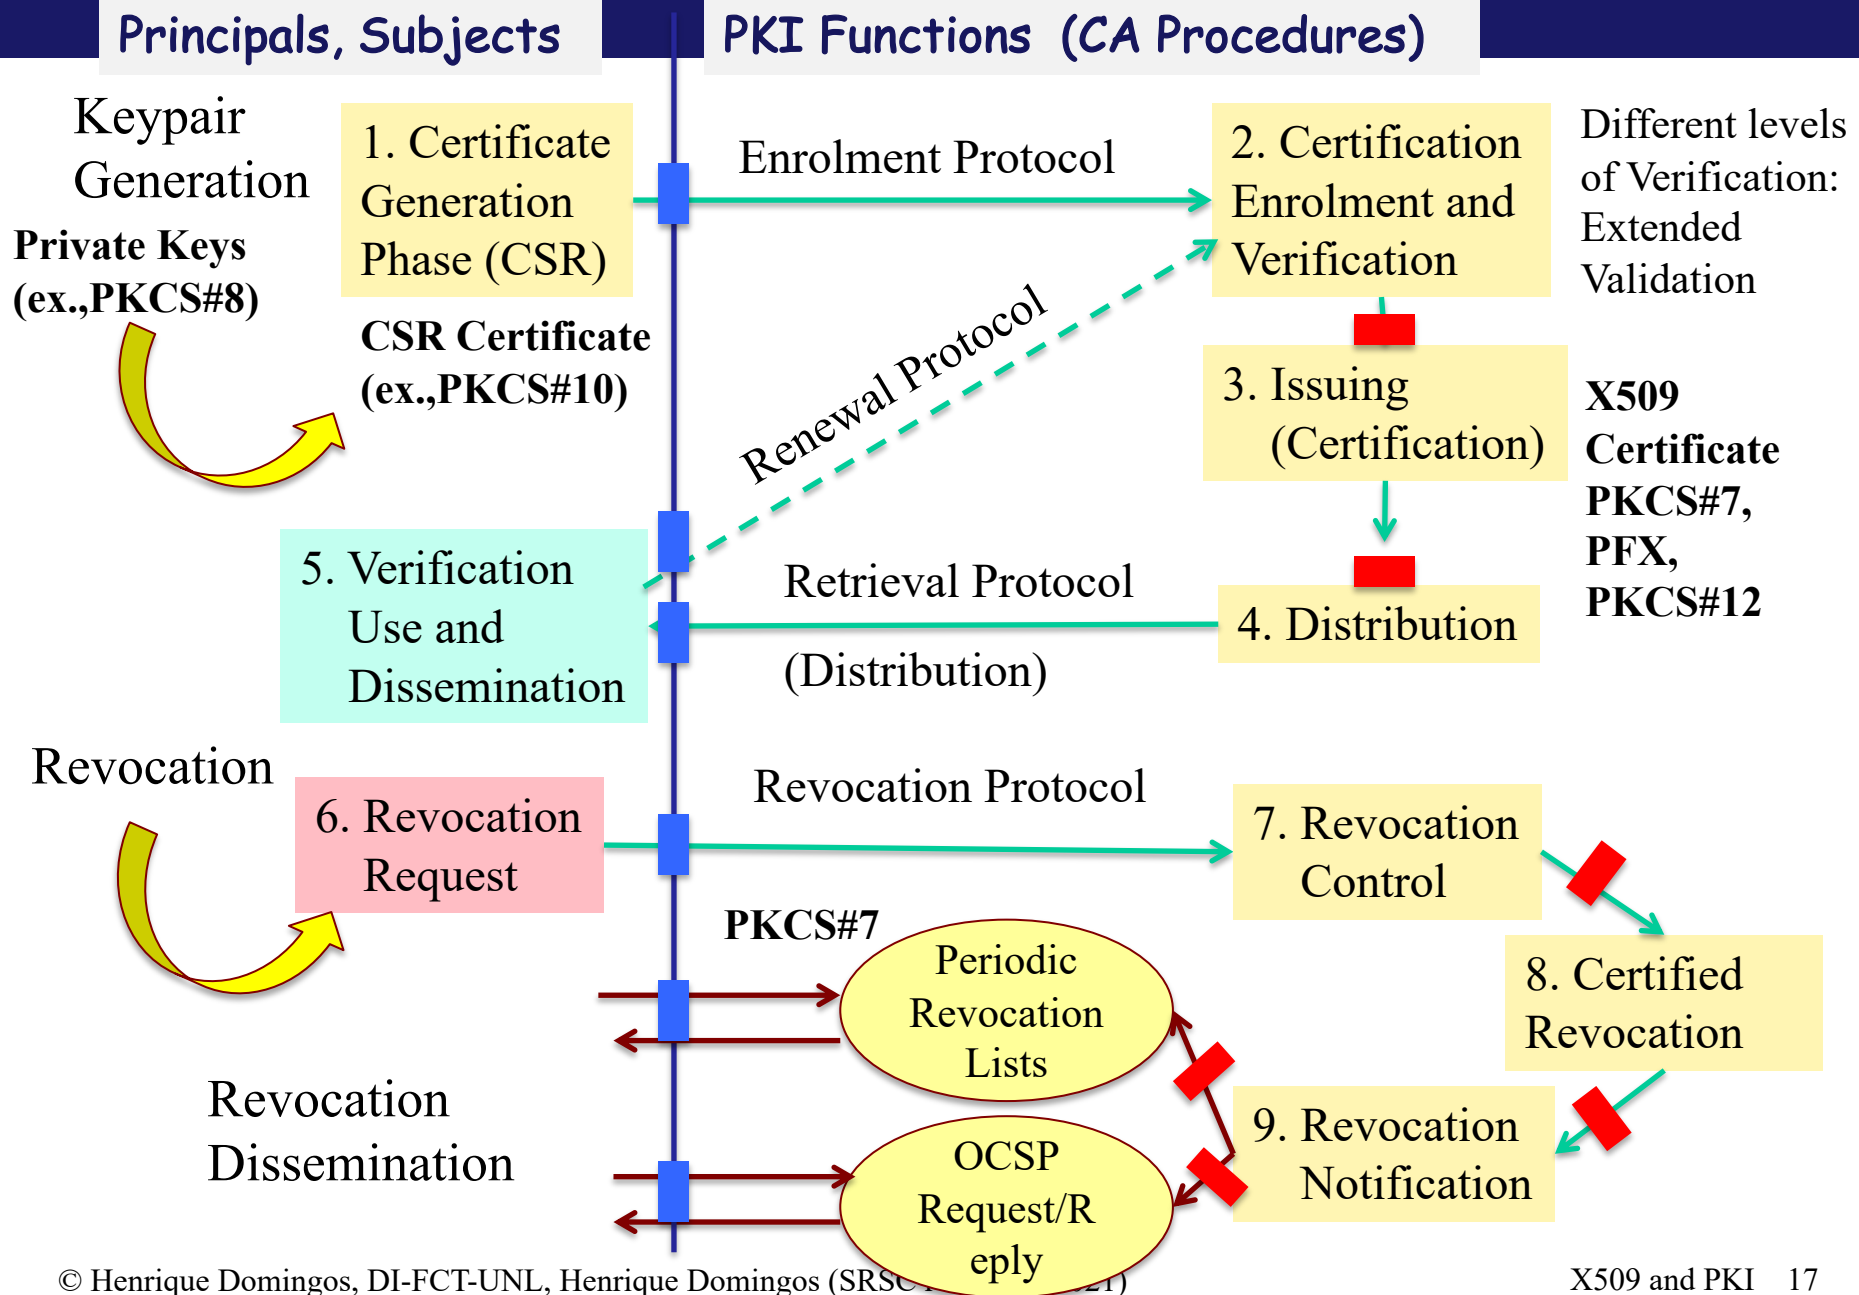

- Introduced by the CA/Browser forum
 - <http://www.cabforum.org/>,
http://en.wikipedia.org/wiki/Extended_Validation_Certificate
 - CAs + Relying Party Application Software Suppliers
- Objective: inclusion of standardized procedures for verifying and expressing awareness of the certificate holder and validity (initially motivated by SSL - TLS certificates)
- Additional layer of protection: promotion of good practice, guidelines, accurate verification processes for issuing X509v3 SSL certificates
 - Verifying the legal, physical and operational existence of the entity
 - Verifying that the identity of the entity matches official records
 - Verifying that the entity has exclusive right to use the domain specified in the EV Certificate
 - Verifying that the entity has properly authorized the issuance of the EV Certificate

Outline

 - Revocation
 - The possible long tail of certification chains
- **PKI - Public Key Infrastructure**
 - PKI Standardization and PKIX Management
- **Complementary: Key Management Issues**

Remember the X509 Life Cycle Management

CSR Validation, extraction and signing (Issuing of Certificates)

Obtaining a User's Certificate

- Certificates: issued by CAs (Functions on PKIs)
 - Any user with access to the public key of the CA can recover and validate the certified user public key
 - Users can exchange certificates and certification chains for verification
 - Can use direct or reverse chains for verification
- Certificates are public and unforgeable (signed by the issuer CA).
 - Possible to send/distribute/disseminate them in protocols or placed in public directories or repositories
 - Note: having a certificate is not a proof of authentication
 - Need a digital signature, exhibiting the public key certificate to validate the signature

Typical life cycle management

Summary of Base Authentication Procedures

One-way authentication and Key dist.

$A[\{ta, ra, IdB\}K_{ab}, \text{Sig}_{K_{privA}}(\text{signData}), \{K_{ab}\}_{K_{pubB}}]$

Two-way (mutual) authentication and Key dist.

$A[\{ta, ra, IdB\}K_{ab}, \text{Sig}_{K_{privA}}(\text{signData}), \{K_{ab}\}_{K_{pubB}}]$

$B[\{tb, rb, IdA\}K_{ba}, \text{Sig}_{K_{privB}}(\text{signData}), \{K_{ba}\}_{K_{pubA}}]$

Three-way (Mutual) authentication and Key Dist.

$A[\{ta, ra, IdB\}K_{ab}, \text{Sig}_{K_{privA}}(\text{signData}), \{K_{ab}\}_{K_{pubB}}]$

$B[\{tb, rb, IdA\}K_{ba}, \text{Sig}_{K_{privB}}(\text{signData}), \{K_{ba}\}_{K_{pubA}}]$

$A\{rb\}$

One-Way Authentication

- 1st message (A->B) used to establish:
 - The authenticated identity of A and that message is from A
 - That the message was intended for B
 - Integrity & originality of message
- Message must include timestamp, *nonce*, B's identity and is signed by A
- May include additional info for B
 - Eg., session key, for implicit key-establishment (session key-envelope)
 - Allows the concatenation of additional confidential content or messaging

Two-Way Authentication

- 2 messages ($A \rightarrow B$, $B \rightarrow A$) establishes in addition:
 - The identity of B and that reply is from B
 - That reply is intended for A
 - Integrity & originality of reply
- Reply includes original nonce from A, also timestamp and a *nonce* from B
- May include additional info for A
 - May establish "half-duplex" session symmetric keys
 - May establish "full-duplex" session symmetric keys (generated from pre-master keys or exchanged seed-material)

Three-Way Authentication

- 3 messages (A→B, B→A, A→B), adding a final round to mutual authentication
 - Enables above authentication without no need of synchronized clocks
- Has reply from A back to B containing signed copy of nonce iterated from B
 - Means that timestamps need not be checked or relied upon, preserving anyway message-freshness and ordering (protocol termination) control

Authentication Procedures

Example of concretizations

Autenticação one-way model:

Ex., One-Way TLS Authentication, S/MIME or PGP Message Authentication

Autenticação two-way (mutual)

Ex., Two-Way TLS Authentication, SET Protocol

Autenticação three-way (mutual)

Ex., Two-Way TLS Authentication and Key-Session Generation and Agreement

Practical protocols

Two forms of management of chain trust

Certificates pre-cached (and managed orthogonally) in trusted certificate stores

Ex., JAVA, keystores

> Advantages ? Drawbacks ?

"On the Fly" validation of trust chains

- Only need "root" certificate pre-cached in trusted stores
- Send certification chains in the authentication handshake

> Advantages ? Drawbacks ?

Base Authentication variants (Variant 1)

One-way authentication and Key dist.

A: I am A

B: Authentication challenge **Cb** for the claimer

A[{ta, ra, **Cbr**, IdB}Kab, Sig_{KprivA}(signData), {Kab}KpubB]

Two-way (mutual) authentication and Key dist.

Three-way (Mutual) authentication and Key Dist.

Base Authentication variants (Ex., Variants 1)

One-way authentication and Key dist.

A: I am A, <my ciphersuite proposal>

B: Challenge **Cb**, <my ciphersuite choice>

A [{ta, ra, **Cbr**, IdB} Kab, Sig_{K_{privA}}(signData), {Kab} K_{pubB}]

Two-way (mutual) authentication and Key dist.

Three-way (Mutual) authentication and Key Dist.

Base Authentication Variants (Ex., Variants 2)

One-way authentication and Key dist.

A: I am A, <my ciphersuite proposal>, $CERT_A$

B: **Challenge Cb**, <my ciphersuite choice>, $CERT_B$

A[{ta, ra, **Cbr**, IdB } K_{ab} , $Sig_{K_{privA}}(signData)$, { K_{ab} } K_{pubB}]

Two-way (mutual) authentication and Key dist.

Three-way (Mutual) authentication and Key Dist.

Base Authentication Procedures (Ex., Variants 3)

One-way authentication and Key dist.

A: I am A, <my ciphersuite proposal>, <Certification Chain>

B[**Cb Challenge**, <my ciphersuite choice>, <Certification Chain>]

A[{ta, ra, **Cbr**, IdB}Kab, Sig_{K_{privA}}(signData), {Kab}K_{pubB}]

Two-way (mutual) authentication and Key dist.

Three-way (Mutual) authentication and Key Dist.

Base Authentication Procedures (Ex., Variants 4)

One-way authentication and Key dist.

A: I am A, <my ciphersuite proposal>, <Certification Chain>

B: **Cb Challenge**, <my ciphersuite choice>, $\text{Sig}_{K_{\text{priv}B}}(\text{signData})$, <Cert Chain>

A[{ta, ra, **Cbr**, IdB } K_{ab} , $\text{Sig}_{K_{\text{priv}A}}(\text{signData})$, {Kab } $K_{\text{pub}B}$]

Two-way (mutual) authentication and Key dist.

Three-way (Mutual) authentication and Key Dist.

Base Authentication Procedures (Ex., Variants 5)

One-way authentication and Key dist.

A: I am A, <my ciphersuite proposal>, <Certification Chain>

B: **Cb**, <my ciphersuite choice>, $\text{Sig}_{K_{\text{priv}B}}(\text{DH}_{\text{pub}B}, \text{SignData})$, <Cert Chain>

A[{ta, ra, **Cbr**, IdB}Ks, $\text{Sig}_{K_{\text{priv}A}}(\text{DH}_{\text{pub}A}, \text{signData})$]

Two-way (mutual) authentication and Key dist.

Three-way (Mutual) authentication and Key Dist.

- **Complementary: Key Management Issues**

Trust and Validation Chains

Common trust based validation

- When all users subscribe to the same **Root Of Trust X**
- Ex., Model for a small community of users (non-scalable, centralized-root trust)
- Any user *A* transmits directly the certificate to any other (*B*, *C*)

What if we have more than one Root (or CA)

No common trust verification conditions

- Model for a large community of users (scalable model)
- Users need to have Public Keys of all the CAs ?
- It may be more practical to consider that
 - There will be several Roots of Trust (CAs),
 - But each of which securely provides its public key to some fraction of the users
 - Then we can use cross-certification links in a certification hierarchy

Notation for a Public Key Certificate:

$CA \ll A \gg = \{A, V, SN, AI, CA, TA, K_{pubA}\}_{SigCA}$

$Y \ll X \gg$ means: Certificate of entity X issued by Y

Verification of certificates => imply that the verifiers previously obtained, in a trusted way, the CA public key

Solution for no Common Trust: Peering

- A obtains $X \ll Y \gg$ from a directory
- A obtains $Y \ll B \gg$ from a directory (or directly from B)
- A uses the chain $Y \ll B \gg, X \ll Y \gg$
B can use the chain: $X \ll A \gg Y \ll X \gg$

or reverse chain $X \ll A \gg X \ll Y \gg$

- Possible generalization for long paths (when joins are at higher levels)

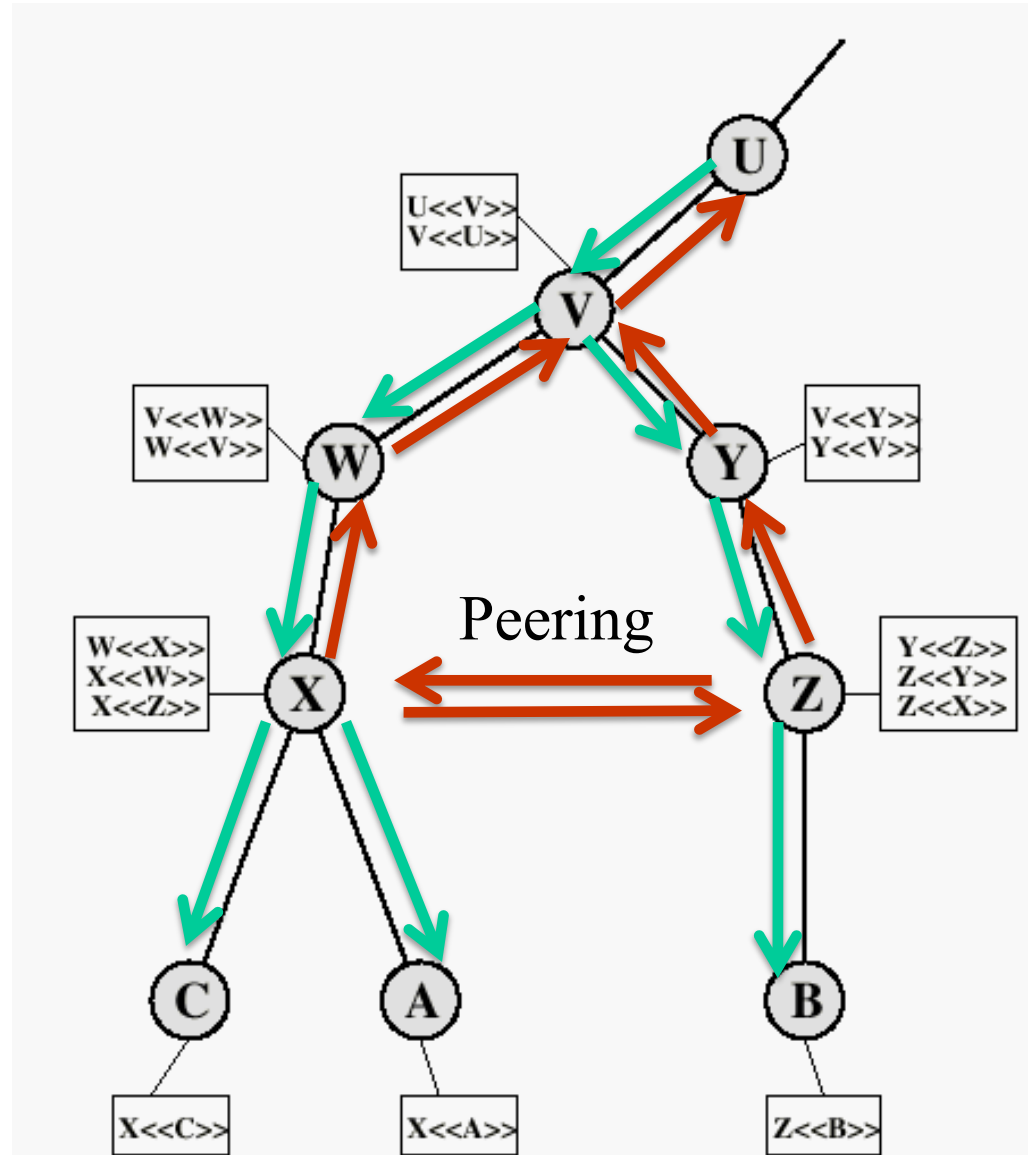

X.509 CA Hierarchy and Chains

- Forward certificates

Forward Chain Validation

- Reverse certificates

Reverse Chain Validation

See a X509v3 Direct Certification Chain in a TLS (HTTPS) connection

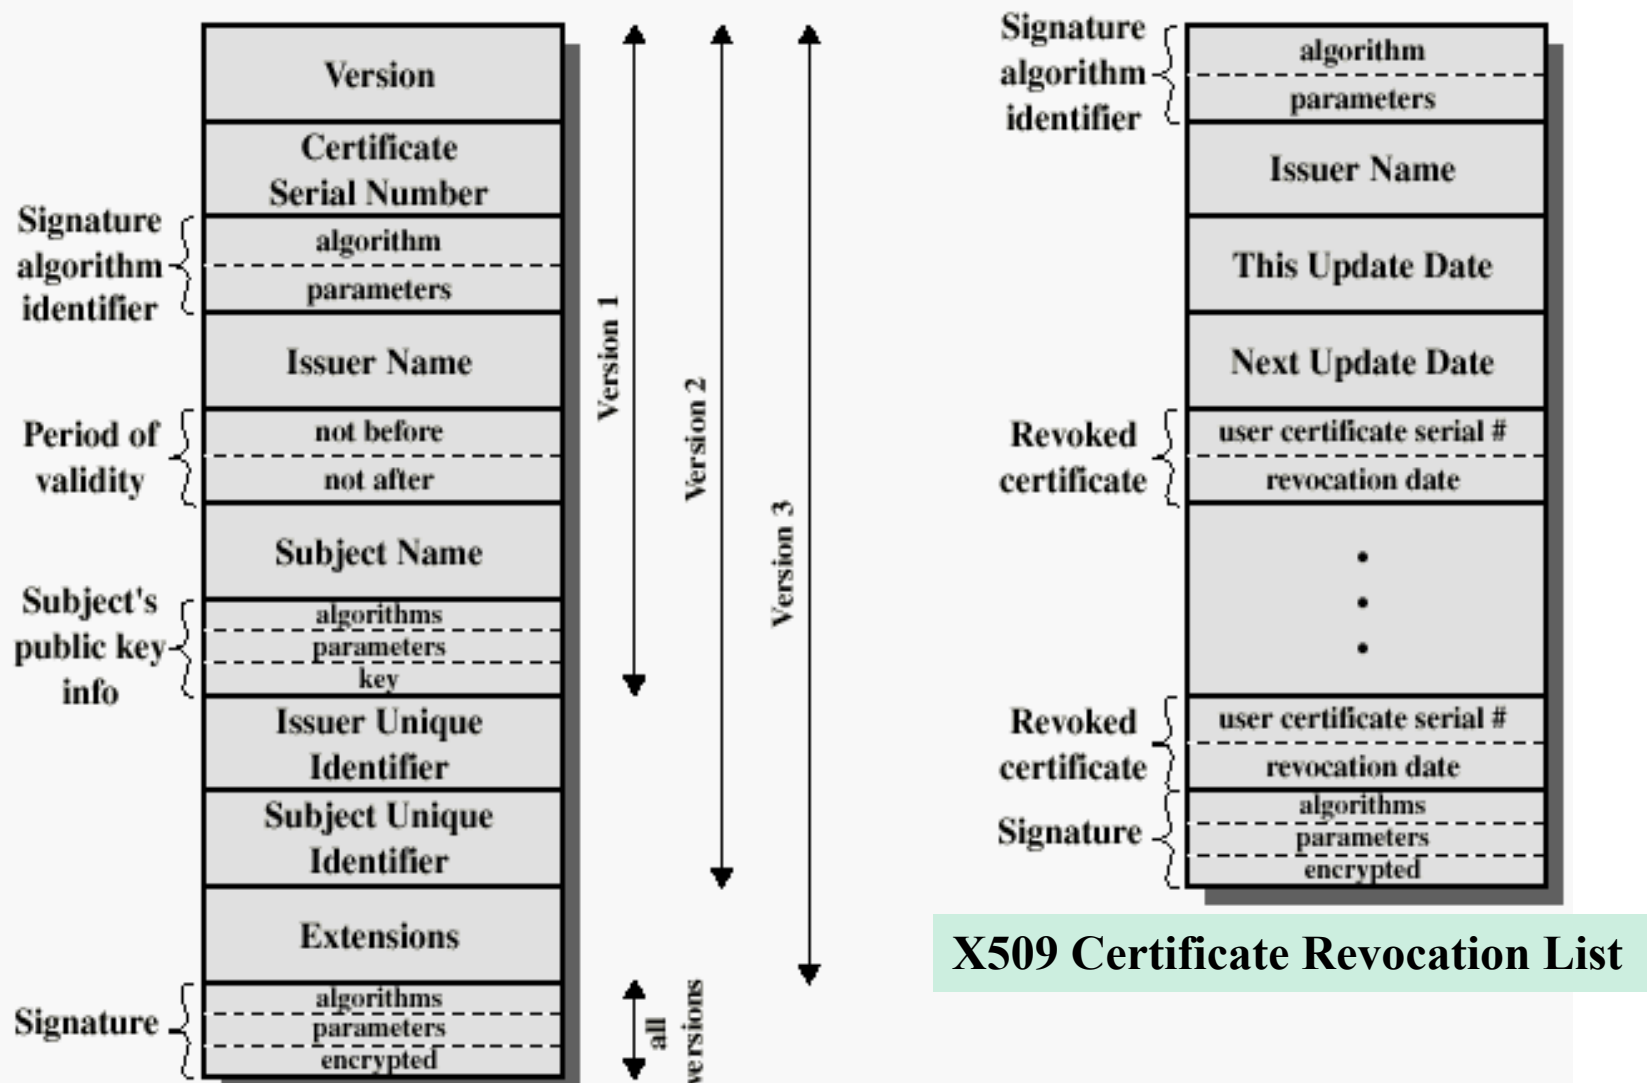

- In general the more common is to have Root CA Public Key certificates in local trusted stores
 - the authentication processing supported with a direct certification chain validation
- Ex., see the CA's Root Certificates in your Java installation
 - Find cacerts in your /...../jre/lib/security hierarchy
- See the certification chain in a TLS (HTTPS) connection:
 - Can use your Browser
 - Or can use openssl
 - `openssl s_client -connect www.feistyduck.com:443`

Outline

- **X509 Authentication**
 - X509 Authentication and Key Management Issues
- **X509 Certificates**
 - X509 and X509 v3 Certificates
 - X509 v3 Extensions
 - Life-Cycle Management of X509 Certificates

 - Revocation
 - The possible long tail of certification chains
- **PKI - Public Key Infrastructure**
 - PKI Standardization and PKIX Management
- **Complementary: Key Management Issues**

X509 Certificates and CRLs

X509 certificate (fields in different versions)

X509 Certificate Revocation List

Revocation of Certificates: Why, When, How

- **Reasons for revocation:**
 - User's private key is assumed to be compromised.
 - User is no longer certified by this CA.
 - CA's certificate is assumed to be compromised.
 - CA's private keys compromised
- **Certificates should not be validated**
 - After the expiration
 - Requires the issuing of a new certificate just before the expiration of the old one
 - The new certificate can be issued by a different CA
 - If the end use is not according with the content (specific attributes, policies, extensions)
 - If it is in a "current" certification revocation list (CRL) issued by the CA that issued the certificate
 - If not validated by synchronous "on line" verification process
 - Via OCSP Protocol

Management of CRLs

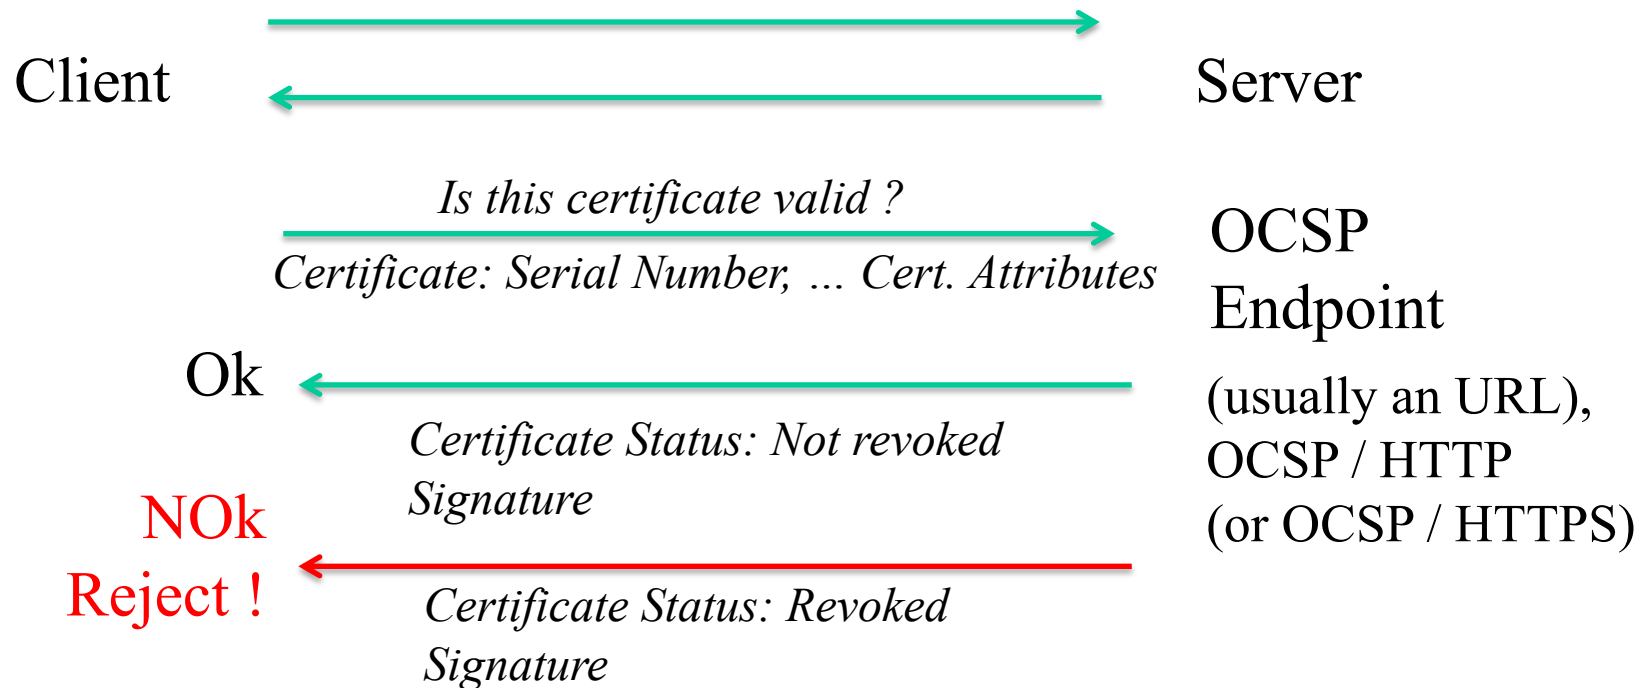

- Maintained by each CA (or CRL issuers' end-points)
- Usually provided in DER or PEM Formats
 - A list of revoked (not expired) certificates issued by that CA, including
 - End-user certificates
 - Possible reverse certificates
- CRLs must be managed by final users (user responsibility)
 - Checked from a directory, every time a certificate is received
 - CRL endpoints (in issued X509 certificates)
- Checked from a local cache, periodically updated (ex., Incremental, Time-Controlled, Serial Number Controlled)
 - **Black Lists: CRLs**
 - **Full-Lists vs. Incremental Lists**
 - **Time-controlled vs. Version-Controlled**
 - Also possible: White Lists as White CRLs

See a CRL, as usually issued by CAs

- Download the current CRL from the CRL endpoint of a given (issued) certificate
- Inspect the CRL (example w/ keytool and openssl):
 keytool -printcrl -file <obtainedcrl>
 or
 openssl crl -inform DER -text -noout -in <obtainedcrl>
 To see the CRL in ASN.1 Syntax format specification

Revocation control w/ the OCSP Protocol

- OCSP - On Line Certificate Status Protocol
 - Client/Server Request/Reply Protocol
 - OCSP Endpoints provided by CAs
 - OCSP Endpoint Attribute in issued X509 Certificates

OCSP (example with openssl)

- Given a certificate (ex.): `certificte.pem` as a chained certificate
- Verify the OCSP endpoint attribute (typically a given URL)
- Verification of all certificates in the chain
- Use of openssl:

Issuer in the chain

```
openssl ocsp -issuer certificate.pem -cert sslcert.pem -url  
<http://OCSP-URL> -text -CAfile CAchainfile.pem
```

Result ...

```
WARNING: no nonce in response

Outline

- **X509 Authentication**
 - X509 Authentication and Key Management Issues
- **X509 Certificates**
 - X509 and X509 v3 Certificates
 - X509 v3 Extensions
 - Life-Cycle Management of X509 Certificates
 - Authentication procedures
 - Forward and reverse certification chains
 - Revocation
 - The possible long tail of certification chains
- **PKI - Public Key Infrastructure**
 - PKI Standardization and PKIX Management
- **Complementary: Key Management Issues**

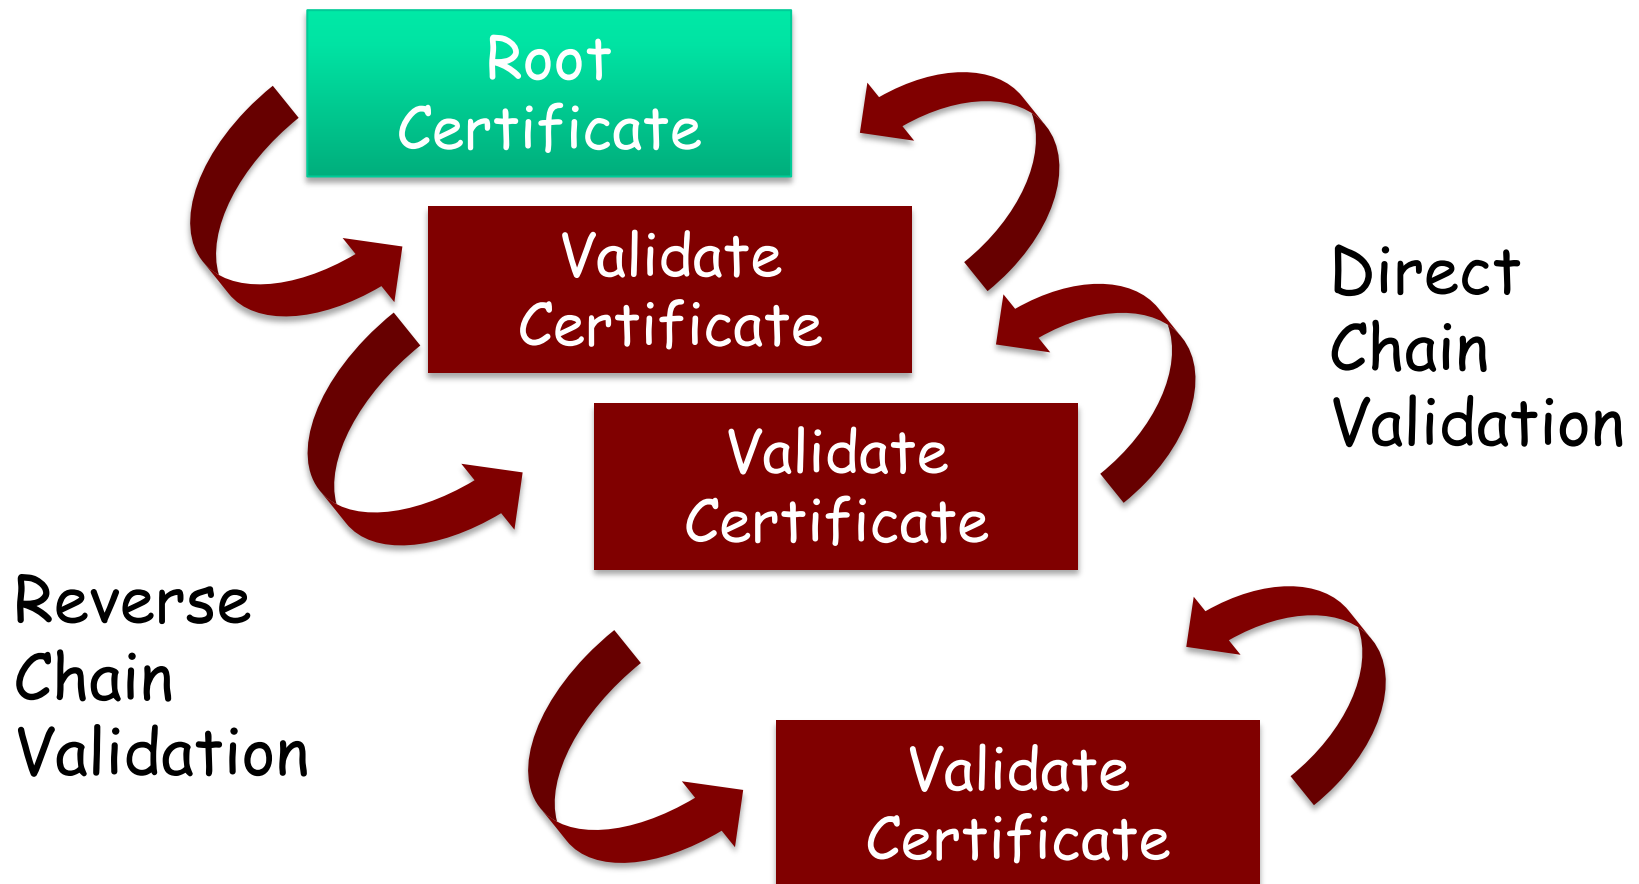

Validation can be complex, in a long tail

- Validation of different attributes
 - Subject Name Attributes:
 - Names, DNS names
 - Issuer Name Attributes
 - O, OU, Cname, ... Validity
- Validation of critical fields and attributes
 - Keysizes, Key usage, ...
 - Extensions: critical attributes and other possible required attributes
 - key usage policy
 - Verification of selected extensions
 - Timestamping
 - CRL endpoints => Look to the more recent issued CRL
 - OCSP endpoints => Possibly validate on the OCSP endpoint
 - ...
 - Integrity Fingerprints
- Basic constraints
 - Certificate authority
- Validation of signatures

Validate
a Certificate

Chain Validation can be more complex yet in a more long tail (direct and/or reverse)

Programming support: ex., JAVA PKI API

<http://docs.oracle.com/javase/8/docs/technotes/guides/security/certpath/CertPathProgGuide.html>

Complexity management issues (and usually flaws)

- Architectural weaknesses
- Errors and issues involving certificate authorities and/or management of PKIs
 - Ex., Verification problems in enrolment processes
- Implementation issues
- Cryptographic weaknesses

SW Certificates/Certification/Validation weaknesses

- Incorrect verification
- Incomplete verification or limited chain levels
- Implementation Bugs

X509v3, Chains, CRL and OCSP in practice

- See in labs the exercises and demos (Lab 7)
 - Use of openssl or keytool (java) tools
 - Generation of Certificates in the Java programming environment
 - Java Keystores to manage private vs. public keys
 - Generation of public key certificates exported from keystores of keypairs
 - Trusted Certificate Stores: keystores containing imported certificates
 - Use of tools for the verification of certificates
 - CRLs
 - Use of OCSP protocol handlers
 - Management of standard formats for certificates
 - Manipulation of certificates in Java programs

Outline

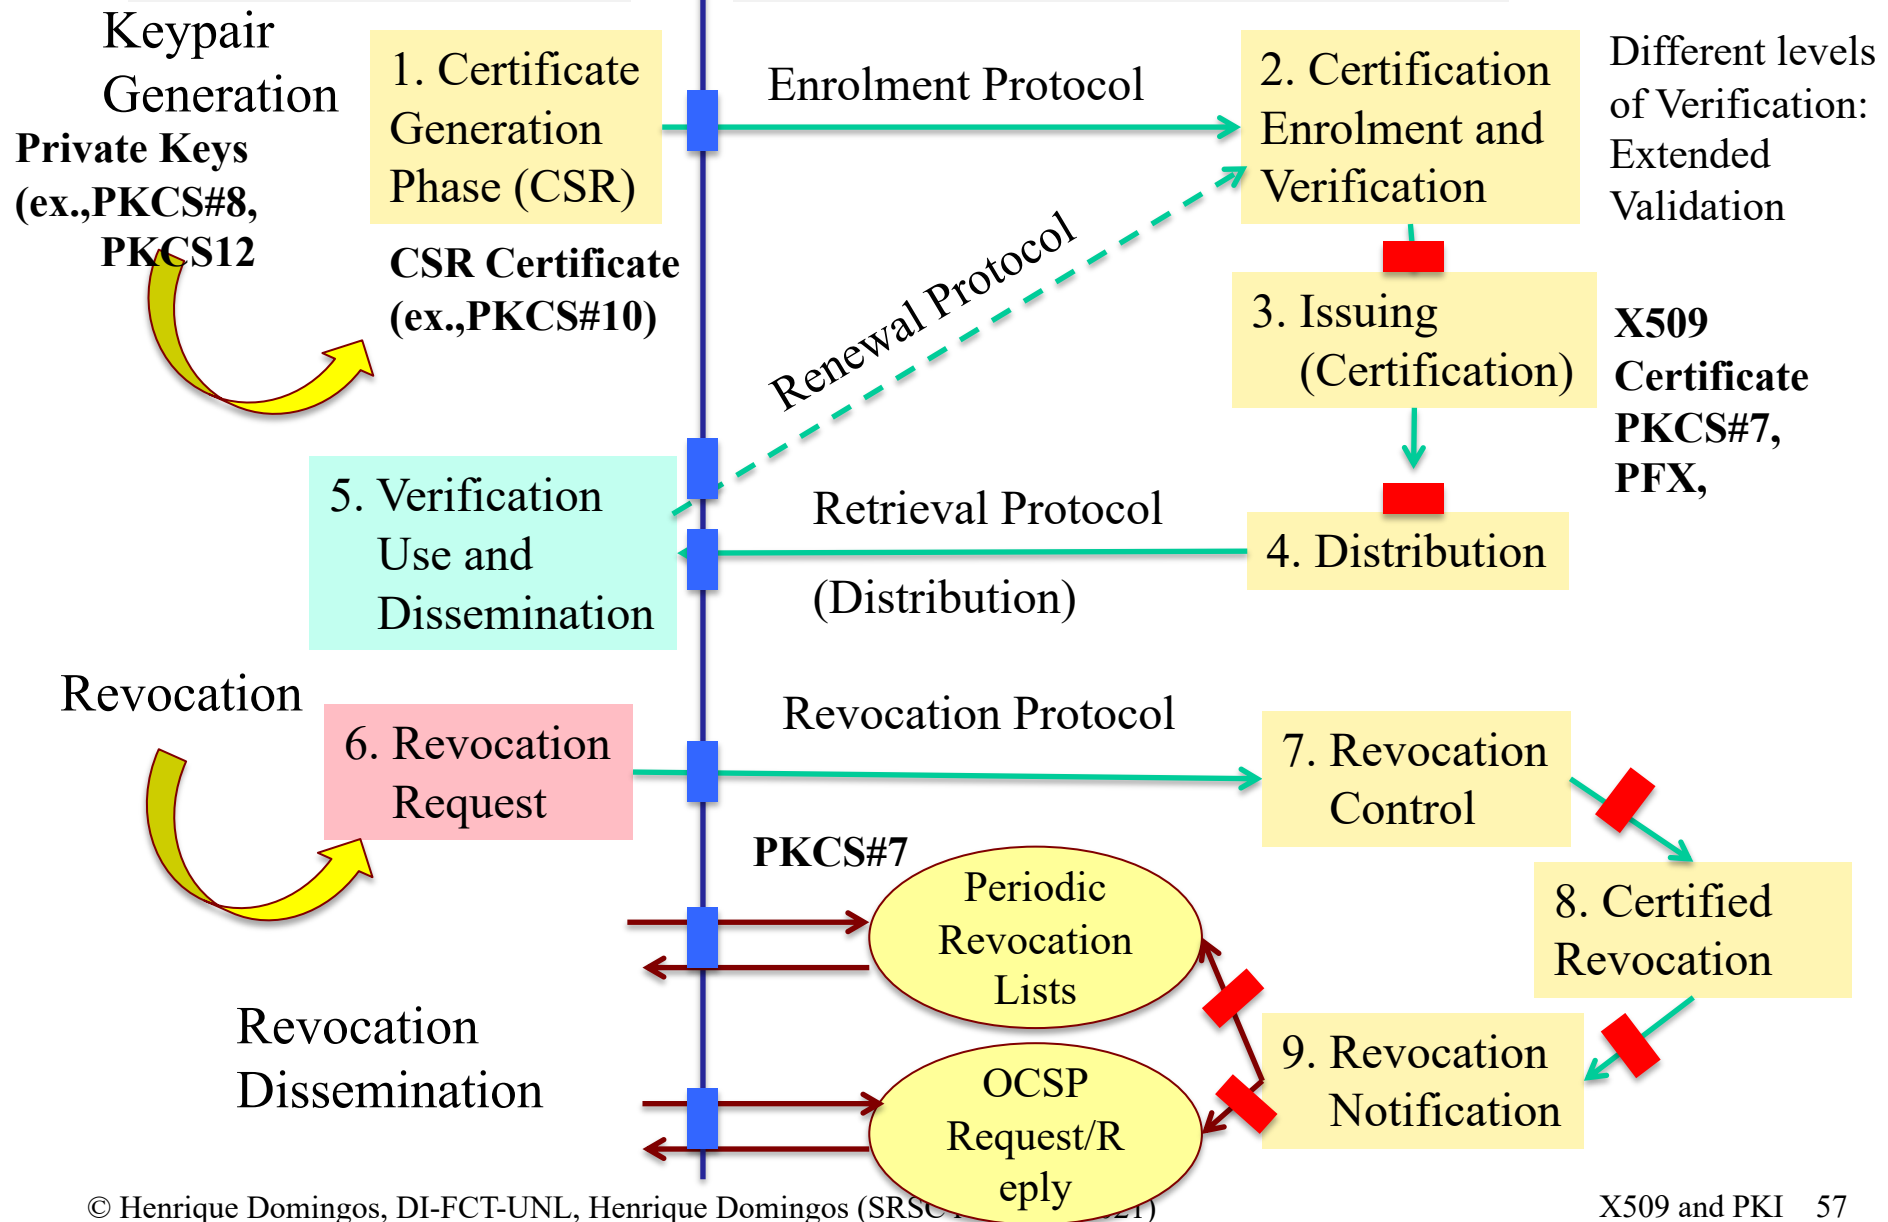

- **X509 Authentication**

Remember the X509 Life Cycle Management

Principals, Subjects

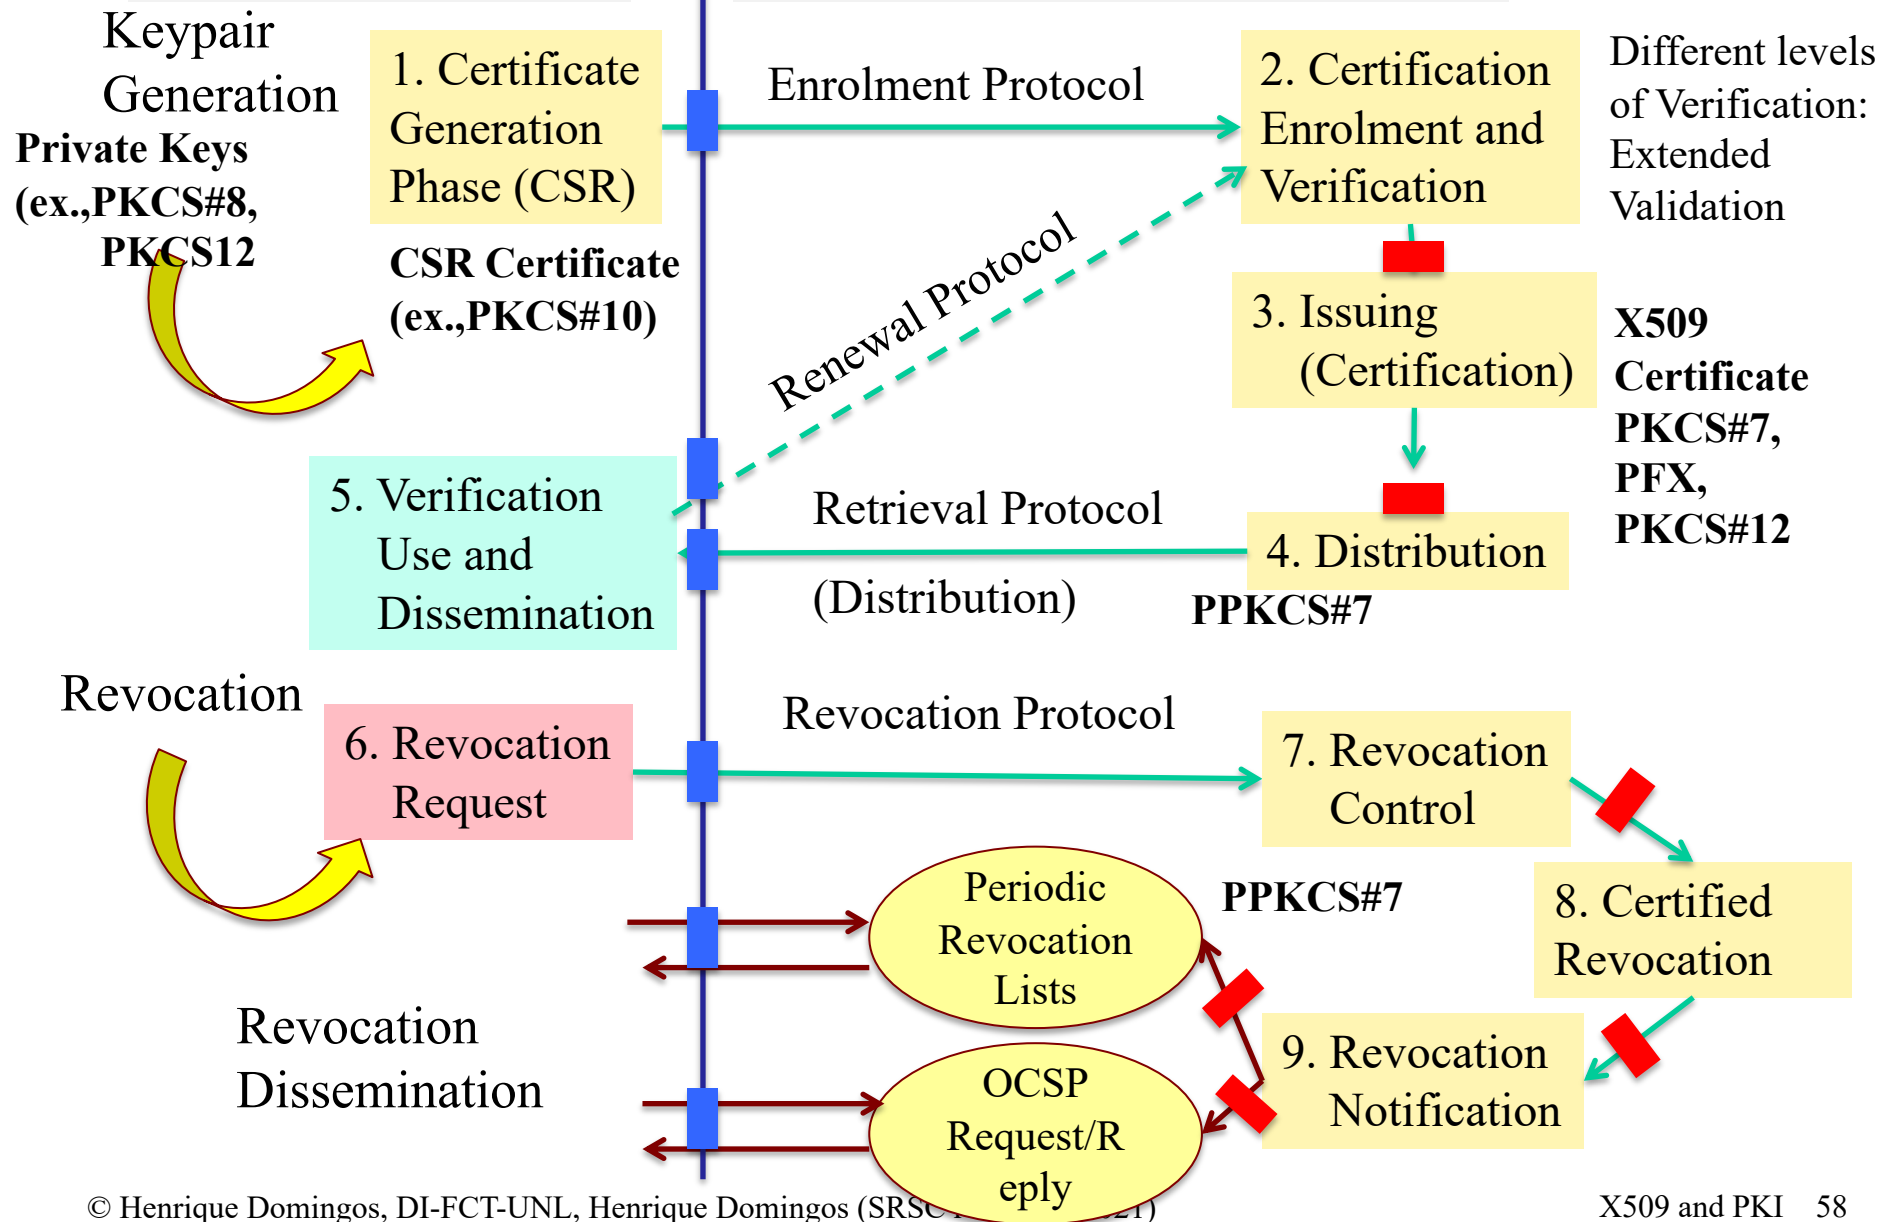

PKI Functions (CA Procedures)

Remember the X509 Life Cycle Management

Principals, Subjects

PKI Functions (CA Procedures)

PKI - Public Key Infrastructure

- A Standard Framework Model
 - a set of: HW, SW, People, Rules, Procedures, Policies and Protocols, needed to create, manage, store, distribute and revoke digital certificates
- Objective: enable secure, convenient and efficient acquisition of public keys, promoting strict and well-known specifications
- Coordination by the IETF X509 (PKIX) WG
- Standardized base for compatibility purposes on the above issues in building PKI Platforms
 - Solutions that can also be used by CAs (Certification Authorities) and Ras (Registration Authorities or CA Registrars)

PKIX Management Functions

- **Registration**
 - Enrollments from users to CAs (directly or through RAs)
 - Offline and Online procedures for mutual authentication
- **Initialization**
 - Initialization and installation of trusted CA certificates
- **Certification**
 - Registration of CSRs (PKCS#10) to obtain CA issued Certificates in standard formats (ex., PKCS#12, PKCS#7)
- **Key Pair Recovery**
 - Restoring encryption/decryption keys
- **Key Pair Update**
 - Regular updates and issuing of new certificates
- **Revocation request**
 - Regular updates and issuing of new certificates
- **Cross certification**
 - Exchanged signed CA public keys, between CAs

Usually,
Interoperability
Using
PEM and
DER
representations

Scale and more extensible trust model

- Different entities involved, acting with different roles in a distributed way: **CAs, RAs, CRL Issuers, CRs**
 - Difference between:
 - **CA**: Certification authorities (Cert. ISSUING)
 - Different level CAs: aggregated in a direct certification chain
 - » Root CA, Level 2 CA, Level 3 CA, etc
 - » Model practically used in "well-known CA companies" or "CA delegation companies"
 - **R**: Registration authorities (REGISTRATION, ENROLLMENT DELEGATION)
 - **CRL Issuers**: (Issuers of CRLs)
 - **CRs or Certification Repositories** (DISTRIBUTION, for on demand REQUEST-REPLY)

PKIX Management Protocols

- Standard protocols between PKIX entities supporting PKIX management functions

Ex:

- **OCSP**: X509 Internet Public Key Infrastructure - Online certification status protocol (OCSP) RFC 6960
 - Update for previous RFC 5912, Obsoletes: RFCs 2560, 6277
- **CMP** - Certificate Management Protocol: RFC 4210 (2015)
- **CMC** - Certificate Management Messages over CMS:
 - RFC 5272 > updated by recent RFC 6402 proposal
- **CMS** - Cryptographic Message Syntax: RFC 5652 (obs. 3852)

See the standardization process from the X509 PKIX IETF WG, ...
<http://datatracker.ietf.org/wg/pkix/>

Formats

Certificates has been encoded and/or digitally signed in different formats (defined in RFC 5280 - PKIX) .

See also, for ex: <https://en.wikipedia.org/wiki/X.509>

Encodings:

- PKCS#10 CSR: Certificate Signed Request format
- PKCS#7 format: Certificates and CRLs - Certificate Revocation Lists dissemination

Certificates and interoperable formats:

DER (binary encoding)

PEM (base64 encoding)

More on Formats

- Encoding Conventions vs. file extensions:
- .pem - (Privacy-enhanced Electronic Mail) Base64 encoded DER certificate, enclosed between "-----BEGIN CERTIFICATE-----" and "-----END CERTIFICATE-----"
- .cer, .crt, .der - usually in binary DER form, but Base64-encoded certificates are common too (see .pem above)
- .p7b, .p7c - PKCS#7 SignedData structure without data, just certificate(s) or CRL(s)
- .p12 - PKCS#12, may contain certificate(s) (public) and private keys (password protected)
- .pfx - PFX, predecessor of PKCS#12

Conversions / Management of Formats

Conversions available in some existent tools

See: openssl and keytool:-)))

Example w/ openssl:

- `openssl x509 -outform der -in certificate.pem -out certificate.der`
- `openssl crl2pkcs7 -nocrl -certfile certificate.cer -out certificate.p7b -certfile CACert.cer`
- `openssl pkcs12 -export -out certificate.pfx -inkey privateKey.key -in certificate.crt -certfile CACert.crt`
- `openssl x509 -inform der -in certificate.cer -out certificate.pem`
- `openssl pkcs7 -print_certs -in certificate.p7b -out certificate.cer`
- `openssl pkcs7 -print_certs -in certificate.p7b -out certificate.cer`
- `openssl pkcs12 -export -in certificate.cer -inkey privateKey.key -out certificate.pfx -certfile CACert.cer`
- `openssl pkcs12 -in certificate.pfx -out certificate.cer -nodes`

Conversions / Management of Formats

Management of CRLs in Java and with Java keytool

- Download and verification
- Can use keytool, KeyStoreExplorer or openssl tools
- Programatically (ex., JAVA, CRL Class, X509CRL SubClass)

<https://docs.oracle.com/javase/7/docs/api/java/security/cert/CRL.html>
