

DI/FCT/UNL
Mestrado Integrado em Engenharia Informática
Course: Computer Networks and Systems Security
1º Semester, 2021/2022
Midterm Frequency Test Nr. 2 (05/Jan/2022)
Test CODE: T2-A798-AF02

Part I – Closed Book Part

Question 1. Consider the methods used to control the revocation of X509v3 certificates

- a) Explain the difference in the revocation control using CRLs (Certificate Revocation Lists) or OCSP (Online Certificate Status Protocol).
- b) In a CRL, how many digital signatures exist for the revocation of the respective certificates?
- c) Given a CRL to control the possible revocation of a certain certificate, explain how the certificate must be searched in the CRL (i.e., what Certificate attribute is used to index the certificate in the list?)
- d) Where is the information related to communication endpoints to obtain the last version of issued CRL or to support the OCSP protocol for a given certificate?
- e) Explain what is a CSR formatted certificate (or PKCS#10) and the objective for which such certificates are used.

Question 2

- a) Considering the PKIX Framework, explain the difference in the roles of RA and CA entities.
- b) Explain the purpose or relevance of the “Cross-Certification” management function, as one of the notions in the PKIX framework model.

Question 3. In the TLS stack (from TLS 1.0 to TLS 1.2), there are different subprotocols: AP (*Alert Protocol*), CCSP (*Change Cipher Spec Protocol*), HP (*Handshake Protocol*), HBEAT e RLP (*Record Layer Protocol*), with the correspondent message types in RLP encapsulations)

- a) What subprotocols are associated to TLS Session-Level abstraction and what subprotocols are associated to the TLS-Connection abstraction?
- b) What subprotocols don't use digital signatures with asymmetric cryptographic methods?
- c) Explain the purpose of the CCSP subprotocol.
- d) What subprotocols above are not included in the version TLS 1.3?
- e) What protocol originated the vulnerability implementation in *openssl*, known as the *Heartbleed* vulnerability?

Question 4

Summarize the main improvements in security and performance comparing TLS v1.3 with the previous TLS 1.0, 1.1 or 1.2 versions.

Question 5

Consider the certificate chain (obtained in a HTTPS connection to the *endpoint* <https://cloudflare.com> as well as the certificate for the entry (www.cloudflare.com) and respective attributes (IN ANNEX)

- Explain why the represented certificate cannot be used as an intermediate or top-level certificate in a certification chain because in this case the chain must be rejected in a validation process.
- Is it possible the use of the certificate the above certificate if a client wants to establish a TLS 1.2 session fixing the *ciphersuite* TLS_ECDHE_RSA_WITH_AES_256_CBC_SHA384? Why?
- Explain the purpose or interest of two different secure hash functions in the FINGERPRINT attributes in the same certificate.
- What type of digital signature and cryptographic algorithm it is used the “Signature” attribute in the “Public Key Info” ? Why ?

Question 6

Consider the following sequence of a traffic capture including TCP and TLS messages (obtained with the Wireshark tool)

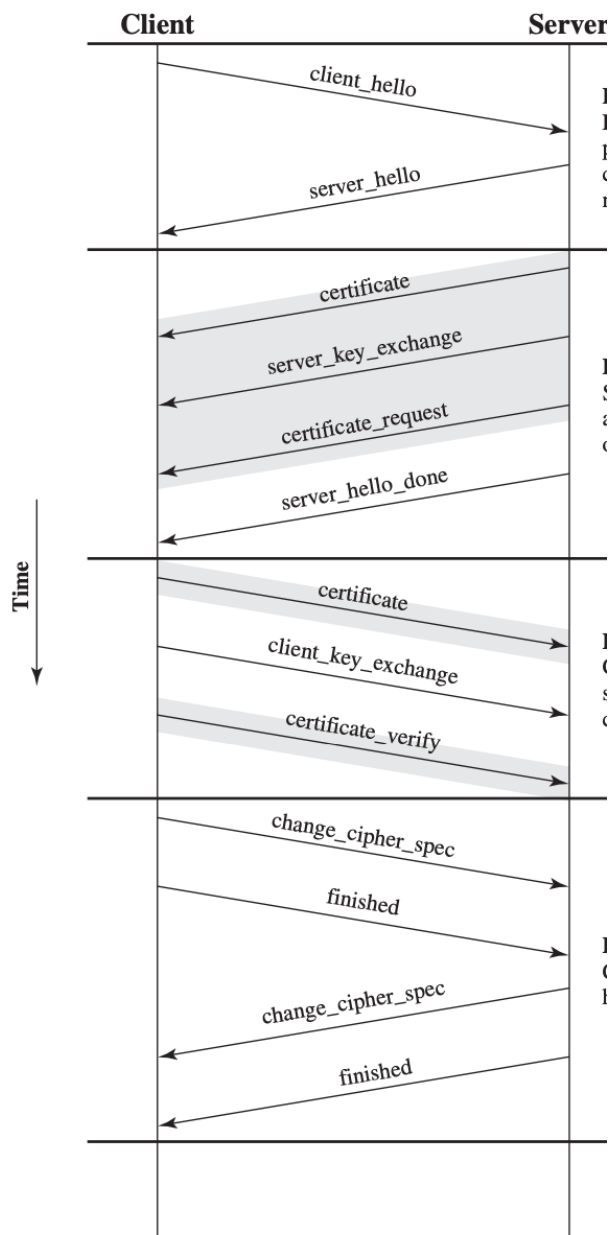

No.	Source	Destination	Protocol	Length	Info
1	192.168.32.1	192.168.32.146	TCP	66	46692 > https [SYN] Seq=0 Win=8192 Len=0 MSS=1460 WS=4 CWR=0 RST=0
2	192.168.32.146	192.168.32.1	TCP	66	https > 46692 [SYN, ACK] Seq=0 Ack=1 Win=29200 Len=0
3	192.168.32.1	192.168.32.146	TCP	54	46692 > https [ACK] Seq=1 Ack=1 Win=65700 Len=0
4	192.168.32.1	192.168.32.146	TLSv1.2	229	Client Hello
5	192.168.32.146	192.168.32.1	TCP	54	https > 46692 [ACK] Seq=1 Ack=176 Win=30336 Len=0
6	192.168.32.146	192.168.32.1	TLSv1.2	1450	Server Hello, Certificate, Server Key Exchange, Server Hello Done
7	192.168.32.1	192.168.32.146	TLSv1.2	216	Client Key Exchange, Change Cipher Spec, Hello Request, Hello Request
8	192.168.32.1	192.168.32.146	TLSv1.2	382	Application Data
9	192.168.32.146	192.168.32.1	TCP	54	https > 46692 [ACK] Seq=1397 Ack=666 Win=32512 Len=0
10	192.168.32.146	192.168.32.1	TLSv1.2	296	New Session Ticket, Change Cipher Spec, Encrypted Handshake Message
11	192.168.32.146	192.168.32.1	TLSv1.2	428	Application Data
12	192.168.32.1	192.168.32.146	TCP	54	46692 > https [ACK] Seq=666 Ack=2013 Win=65700 Len=0
13	192.168.32.1	192.168.32.146	TLSv1.2	382	Application Data
14	192.168.32.146	192.168.32.1	TLSv1.2	428	Application Data
15	192.168.32.1	192.168.32.146	TCP	54	46692 > https [ACK] Seq=994 Ack=2387 Win=65324 Len=0

- Can you say, unequivocally, what authentication mode was used from the following ones: SERVER-ONLY Authentication; CLIENT-ONLY AUTHENTICATION; SERVER-ONLY AUTHENTICATION with a possible inversion of TCP Client Role in the TLS Server Role; or MUTUAL AUTHENTICATION ? Why ?
- What is the message in the flow that defined the TLS *ciphersuite* that will be used by the Client and the Server after the conclusion of the handshake with success

Question 7 . The TLS specification is today materialized in two different encapsulations, using TCP (case of TLS/TCP) and UDP (case of DTLS/UDP), independently of the TLS or DTLS version (example, TLS v1.2 or DTLS v1.2)

Given the *handshake* reference flow (valid for DTLS or TLS) explain why is not expected to observe the message *certificate-verify* sent by the client if we don't observe previously the message *certificate* also sent by the client or if the message *certificate* sent by the client has a null

payload? Explain this considering the purpose or context as well as the cryptographic support for the message-type *certificate verify*.

Question 8

Answer this question considering the context of implementation and specification OPTION of your Project Assignment #2, as delivered for evaluation.

Considering all the possible encapsulations for overlaying SAPKDP and SRTSP protocols: (according to the possible overlaying options **A, B, C, D or E**):

ENCAP 1) SAPKDP / TLS / TCP (overlaying encapsulation for Option A and Part of Option D)

ENCAP 2) SAPKDP / DTLS / UDP (overlaying encapsulation for Option E

ENCAP 3) SRTSP / DTLS / UDP (Corresponding to Option C)

ENCAP 4) SRTSP with partial encapsulations in TLS / UDP and DTLS / UDP (corresponding to Option B or part of options D and E)

- a) What encapsulation (ENCAP 1, 2, 3 or 4) corresponds to your implementation of Project Assignment #2 ?
- b) Considering the following security properties (from B1 to B6) and those already supported by the overlayed SAPKDP or SRTSP protocols, previously to the implementation of the Project Assignment #2 and refer what properties you consider as:

REDUNDANT SECURITY PROPERTIES IN THE SOLUTION AFTER PA#2

ENFORCED SECURITY PROPERTIES IN THE SOLUTION AFTER PA#2

NEW SECURITY PROPERTIES, IN THE SOLUTION AFTER PA#2, NOT SUPPORTED BEFORE

B1) Peer-Authentication

B2) Non-Repudiation

B3) Message Confidentiality

B4) Traffic-Flow Confidentiality

B5) Message Integrity

B6) Mitigation of DoS
